Model No.

Seal symbol*
No symbol: Without seals
UU: Seals attached on both ends
U: Seal attached on one end (marked side)
UT: Seal attached on one end (unmarked side)

Radial clearance symbol
CC0: Negative clearance (preload)
C0: Positive clearance (no preload)

Accuracy symbol
No symbol: Normal grade (grade 0)
P6: Rotational accuracy grade 6
P5: Rotational accuracy grade 5
P4: Rotational accuracy grade 4

Accuracy target symbol
No symbol: Rotational accuracy of the inner ring
R: Rotational accuracy of the outer ring
B: Rotational accuracy of both the inner ring and outer ring

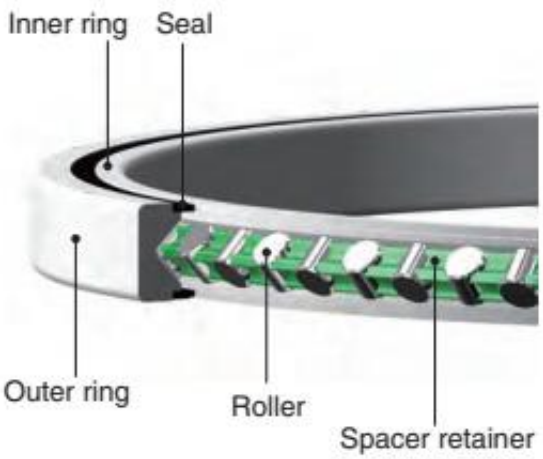
Considerations for model RAU (Small-diameter thin type. Width: 5mm)
Seals are not available. The only radial clearance available is C0.* The only accuracy available is normal grade (grade 0).

For a compact and lightweight system

Micro Cross-Roller Ring with inner diameter of 10 mm and outer diameter of 21 mm

More compact than a conventional angular contact ball bearing

Spacer retainer enables smooth movement and high rotation accuracy.



Structure

In the RAU, the rollers travel on the V-shaped raceways ground into the inner and outer rings.

Alternating rollers are arrayed orthogonally so that one bearing can support loads and moments in any direction.

Also, because of the integrated structure, the RAU can be used for either inner ring or outer ring rotation.

Fig. 1 Structure of Cross Roller-Ring Model RAU

1. Compact and Rigid

The RAU is more compact and lighter weight than a double row angular contact ball bearing. It is also more rigid, even though it is made as compact as possible.

Comparison of cross-sectional area and mass

Model No.	RAU5005	7910 (DB)
Cross-sectional area	27.5mm²	264mm²
Mass	32g	260g

2. Light Weight

The cross-sectional area of the model RAU is 57% smaller than theCross-Roller Ring model RA, which was previously the thinnest ever. This enables further weight reduction. The line-up also includes other models

whose inner diameters are the smallest to date: 10, 15, 20, 30, and 40mm.
